

ION EXCHANGE RESINS

SOFTENING RESIN

Water softening ion-exchange resins are used to replace the magnesium and calcium ions found in hard water. The resin can be regenerated by washing it with salt (NaCl). The calcium and magnesium ions migrate off the resin, being replaced by sodium ions from the solution until a new equilibrium is reached.

0802051144	Purolite A850S Anion Resin	25L		
0802058843	Purolite A860S Anion Resin	25L		
0802021119	Purolite A520E Nitrate Selective Resin	25L		

ION EXCHANGE RESINS

MIXED BED RESIN

Mixed bed resins contain both cation and anion resins so most minerals are held within the resin and pure water is produced. Typically mixed bed resins can produce water of 1 to 5 uS/cm while the purer versions can get to 0.5uS/cm.
